Fictional Research Statement

Imaginary research agenda

My research takes place entirely in the invented setting of Exampleland. It asks how imaginary institutions evaluate simulated decision engines without weakening fictional accountability. I study who defines each hypothetical problem, what synthetic evidence counts, how invented errors are surfaced, and whether sample explanations change staged decisions.

Simulated current programme

Within this fictional setting, my current programme combines synthetic audits, counterfactual trials, and staged workshops. The audits compare placeholder procedures with generated decisions. The trials test whether invented forms of documentation alter those decisions. The workshops ask imaginary communities to define harms omitted from sample metrics.

One invented project follows sample-service teams as they review a hypothetical eligibility engine. It compares a fictional model record with a simulated review protocol. Its outcomes are generated errors, staged deployment conditions, and documented disagreement among placeholder participants.

Hypothetical future work

The next fictional phase will examine how oversight travels among Exampleland's imaginary organisations. It will compare sample procurement, internal review, and external audit as three simulated pathways for institutional learning. The programme will produce invented instruments, hypothetical evaluations, and guidance co-developed with fictional partners; none of these entities or claims maps to the real world.
